## Climate-resilient walking and cycling paths

Encouraging residents in European cities to walk and cycle more means to better anticipate the risks associated with global warming: heatwaves, hail storms, floods, etc. It's also about creating comfortable and safe infrastructure that take them into account.

Streets2030 joins climate adaptation and active mobility efforts in the quest to increase climate resilience of streets. The project will assess, pilot and mainstream innovative green and grey active travel infrastructure solutions in six urban areas across the Netherlands, Germany, Ireland, France and Belgium.
