VALORANT

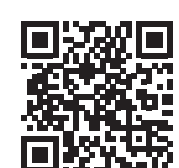

A second life for apple leftovers through smart cascade valorisation

Apple pulp and other residue streams mark the first step in VALORANT's cascade pathway, where overlooked residues reveal new value. By analysing these materials, the project identifies not only polyphenols but also routes for further valorisation, from proteins to bio-based energy.

By turning surplus fruit, vegetables and flowers into multiple high-value outcomes, VALORANT helps growers reduce waste and supports more circular communities across North-West Europe.
